

MAAP #117: New Oil Road Deeper into Yasuni National Park (Ecuador)

Yasuni National Park, located in the heart of the Ecuadorian Amazon, is one of the most biodiverse spots in the world and overlaps ancestral Waorani territory. In the recent [MAAP #114](#), we showed the construction of four new oil drilling platforms (and access road) in the controversial ITT oil block, located in the heart of Yasuni.

Here, we show that, beginning in mid-March **2020**, we detected the construction of a new access road heading further south from the last platform (see **Images 1 and 2**). As of early May, this road construction was **2.2 km** through primary forest.

Implications of the New Oil Road

This finding is concerning because it brings oil development closer to the "Zona Intangible," a reserve created to protect the territory of indigenous people in voluntary isolation (Tagaeri, Taromenane), isolated relatives of the Waorani.

In **Image 2**, the location of the new road (indicated in **red**) is shown approaching several planned oil drilling platforms just outside the buffer zone of the Zona Intangible. **Image 3** shows a zoom of this area.

It is also concerning because construction is occurring during the **coronavirus pandemic**.
